Creating a Virtual Machine on the Hypervisor

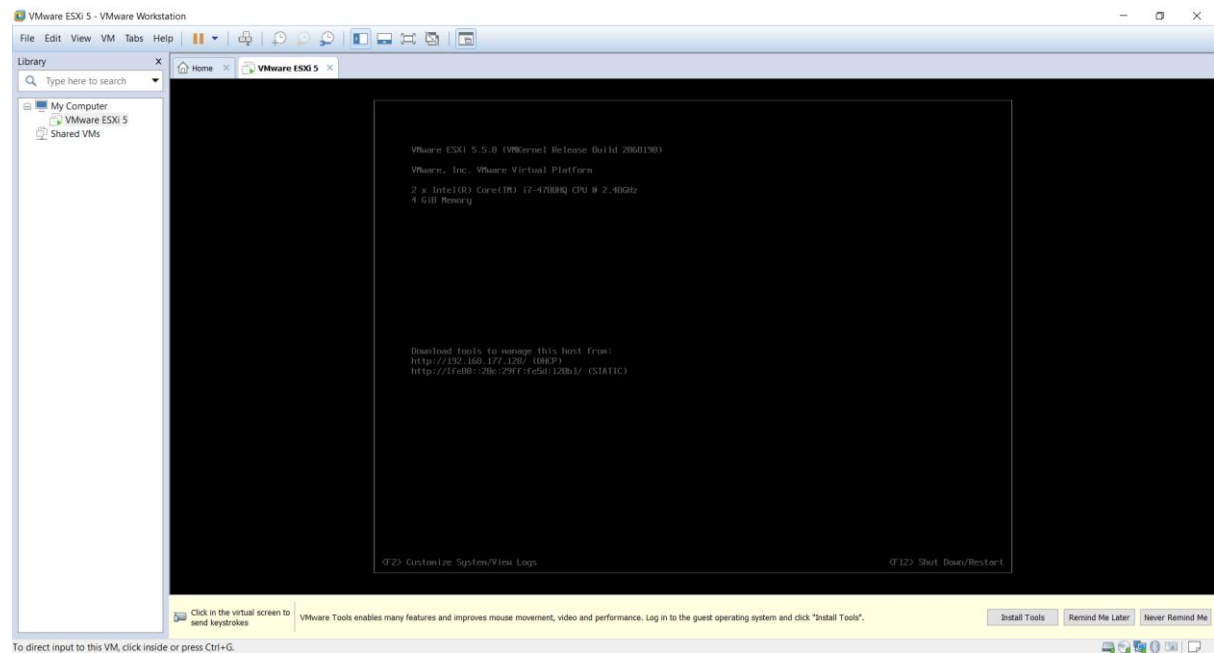

Name: Praneeth Chamara Parनावithana

SLIIT ID: IT13003388

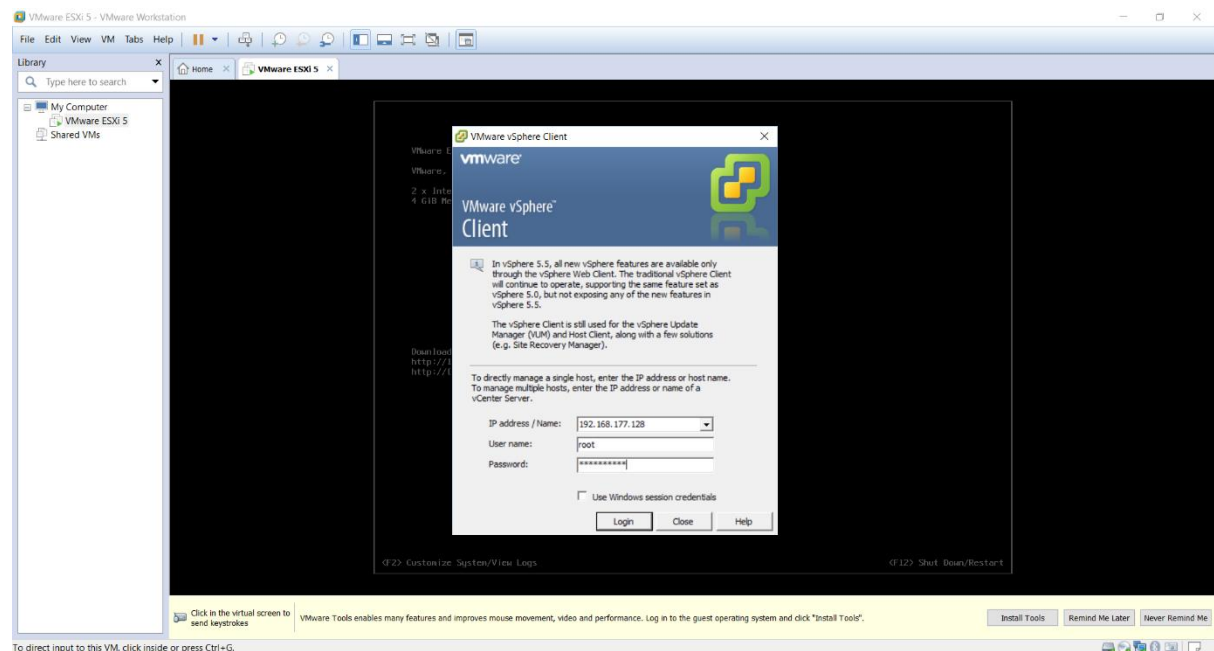

Practical Session: Weekend

Creating a Virtual Machine on the Hypervisor

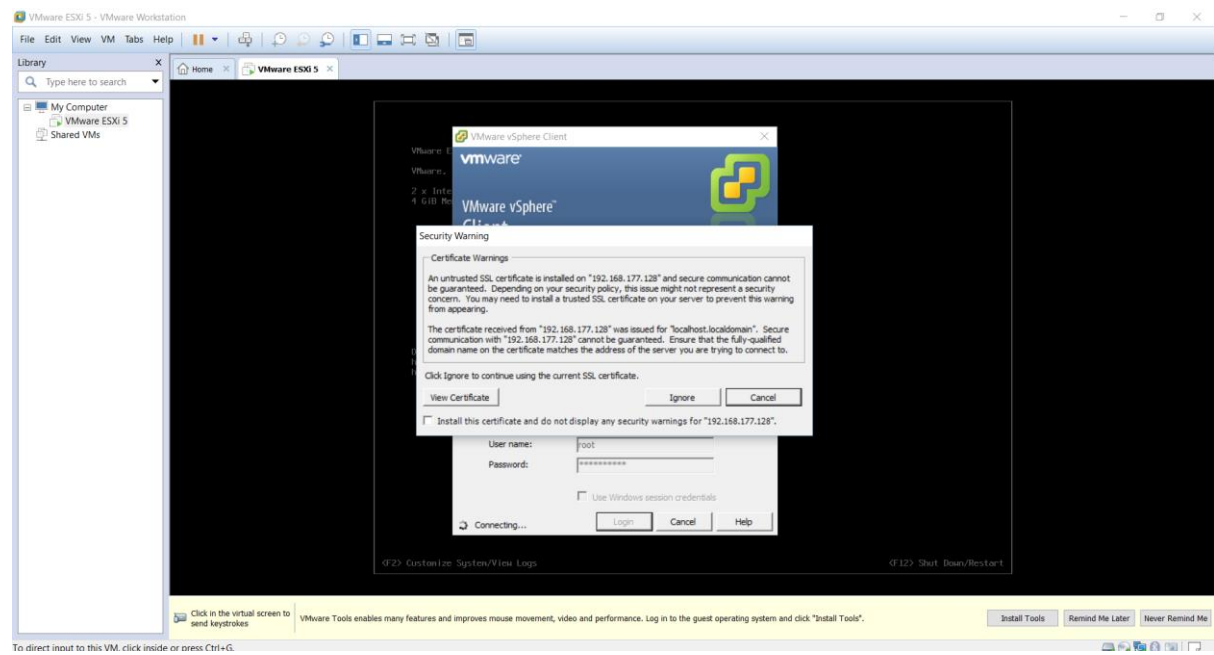

Step 01: Power on the ESXi 5 in VMware Workstation.

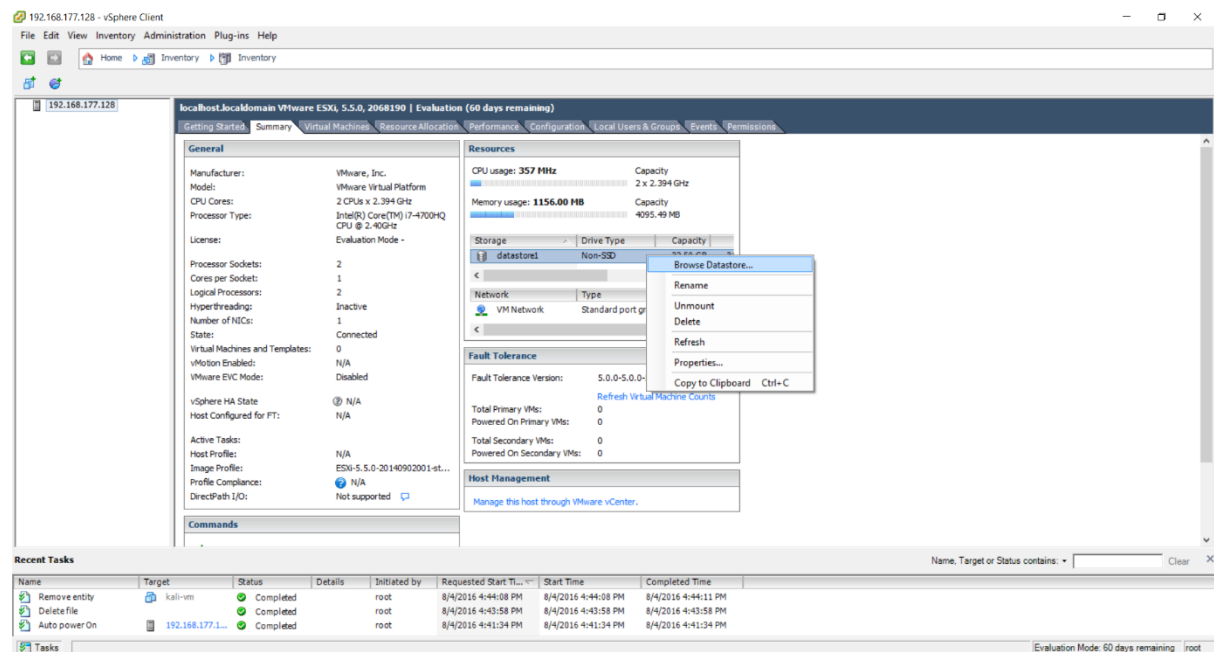

Step 02: Install and run the VMware vSphere Client. Configure the IP address of ESXi 5 host, the root username and password. Then click 'Login' to login.

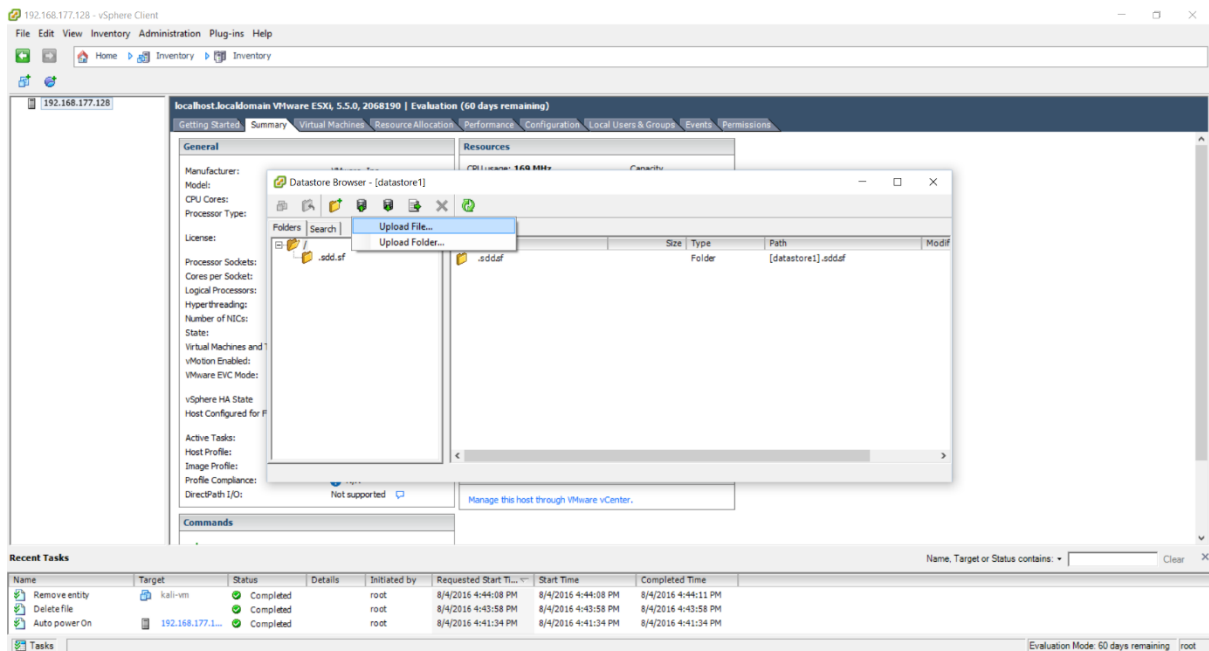

Step 03: Click ‘Ignore’ in SSL certificate security warning.

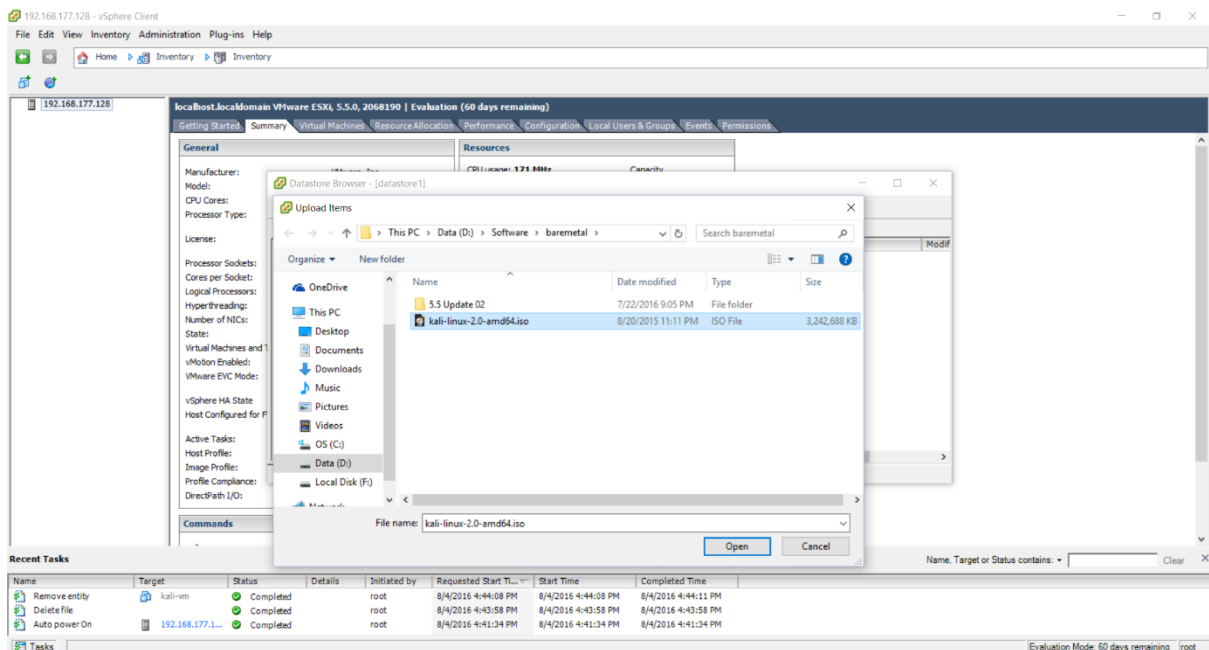

Step 04: Navigate to the ‘Summary’ tab and right click on ‘datastore1’ from ‘Storage’ category then choose ‘Browse Datastore...’.

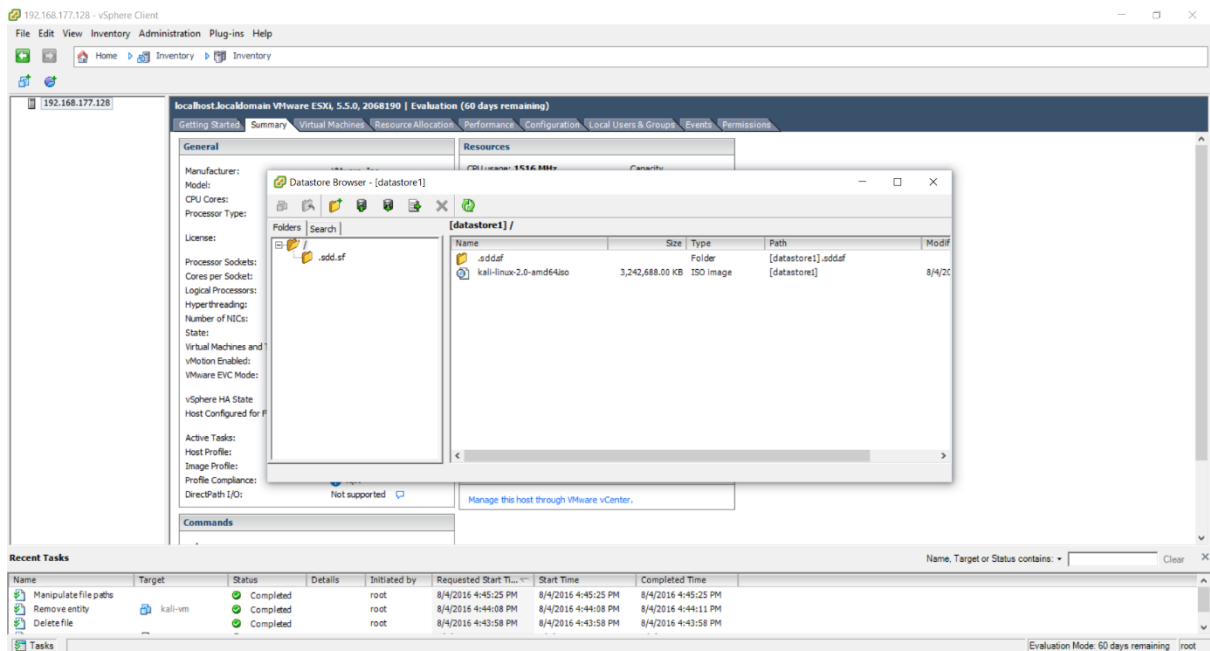

Step 05: Select the option ‘Upload File’ from ‘Upload files to this datastore’.

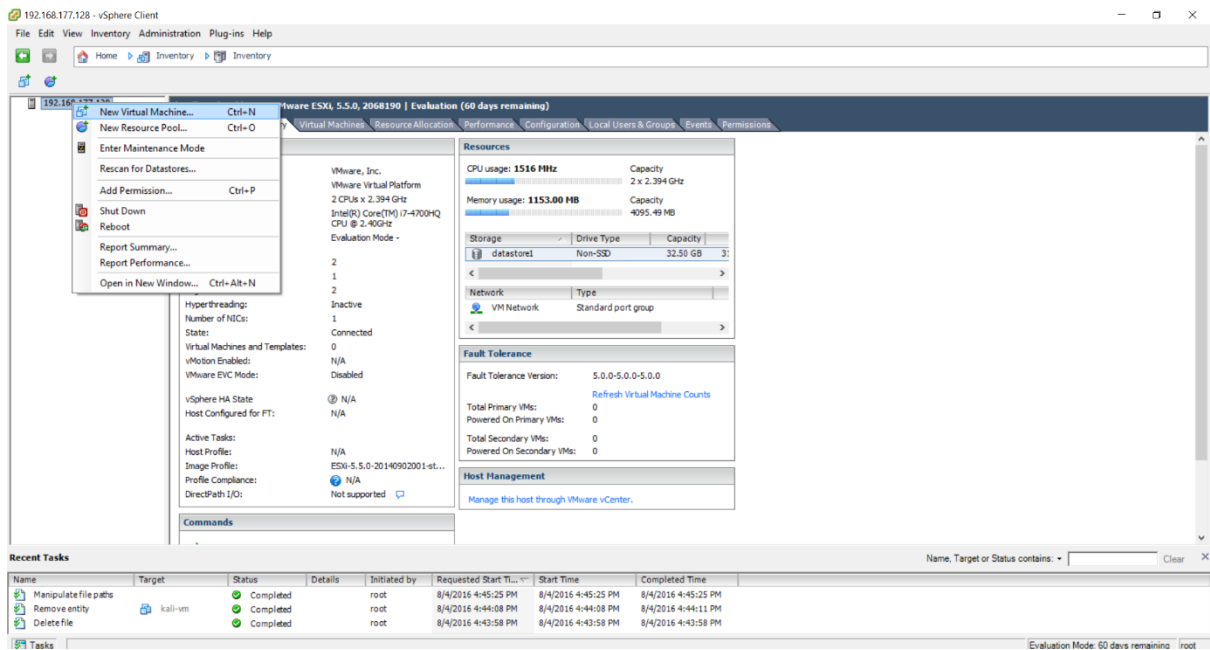

Step 06: Browse for the OS file and close the window one uploading is finished.

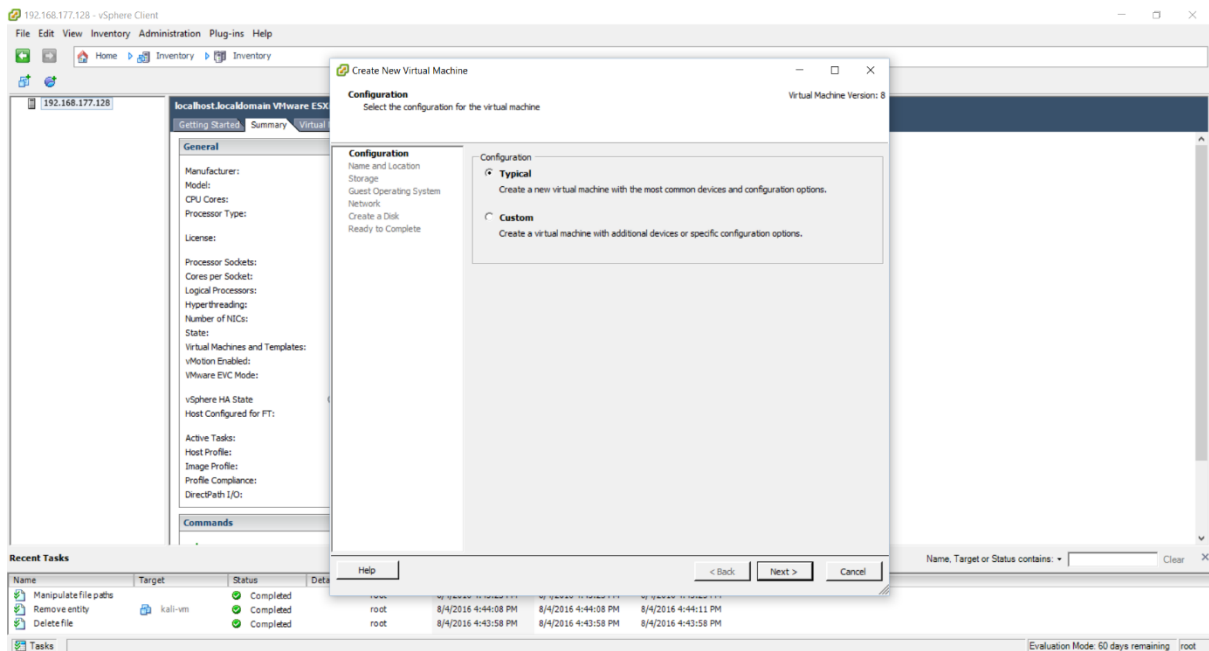

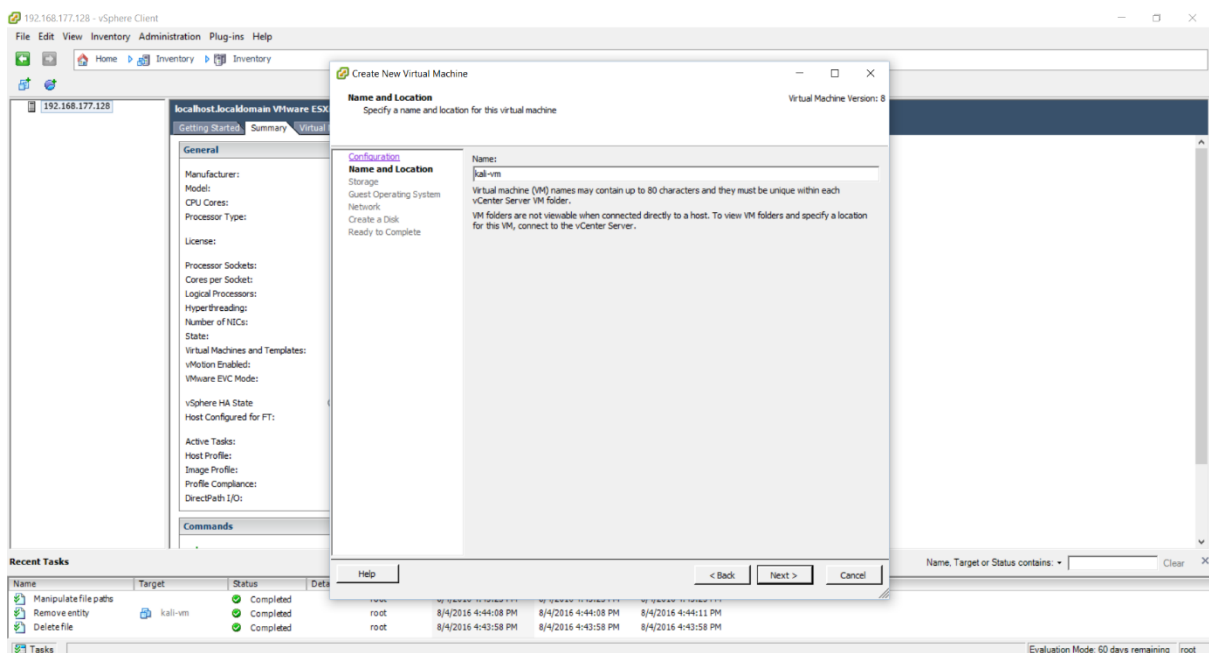

Step 07: Right click on the host and click on 'New Virtual Machine'.

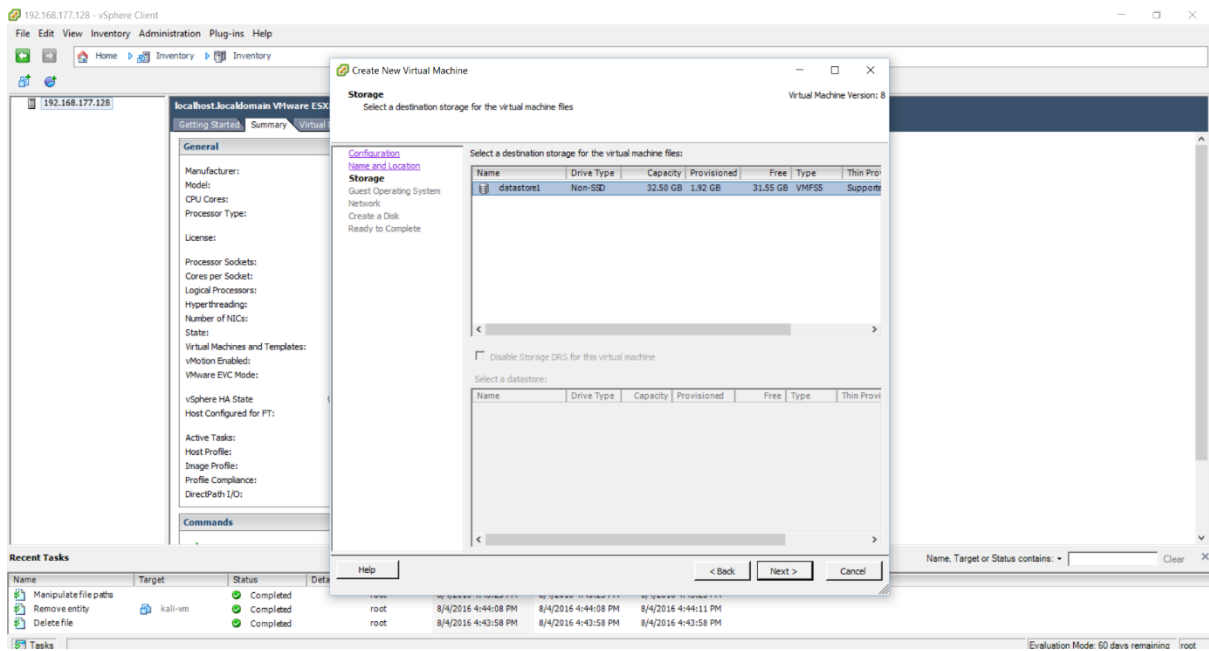

Step 08: Select 'Typical' Configuration and click 'Next' to proceed.

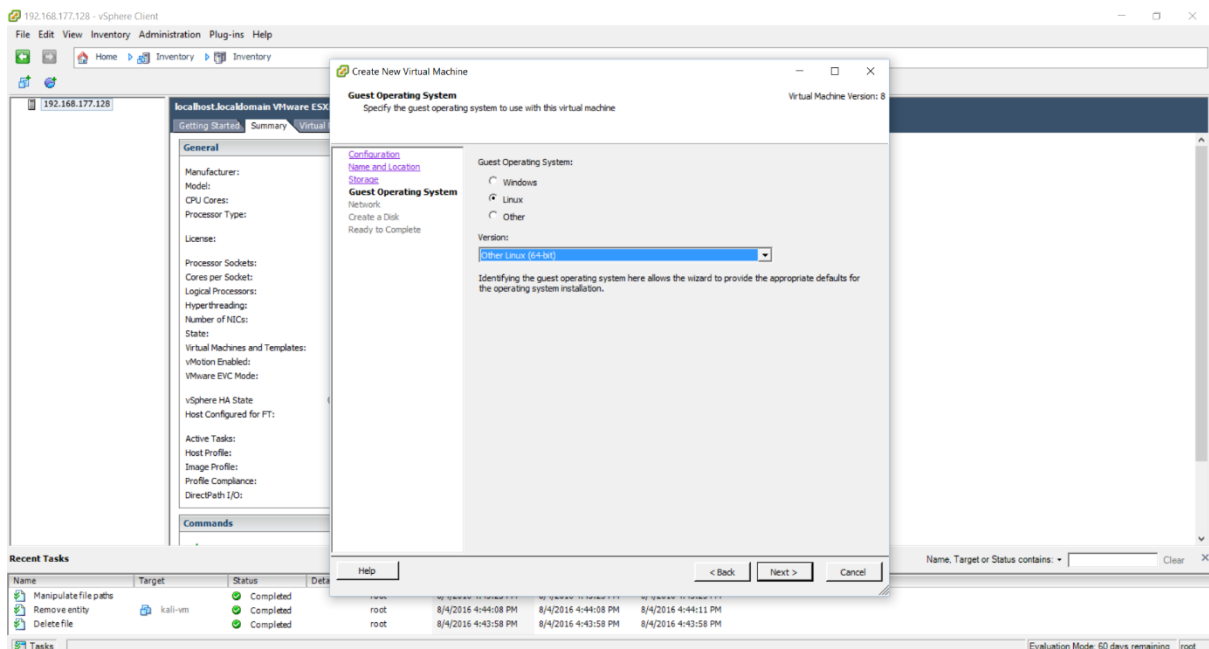

Step 09: Name your virtual machine and click 'Next'.

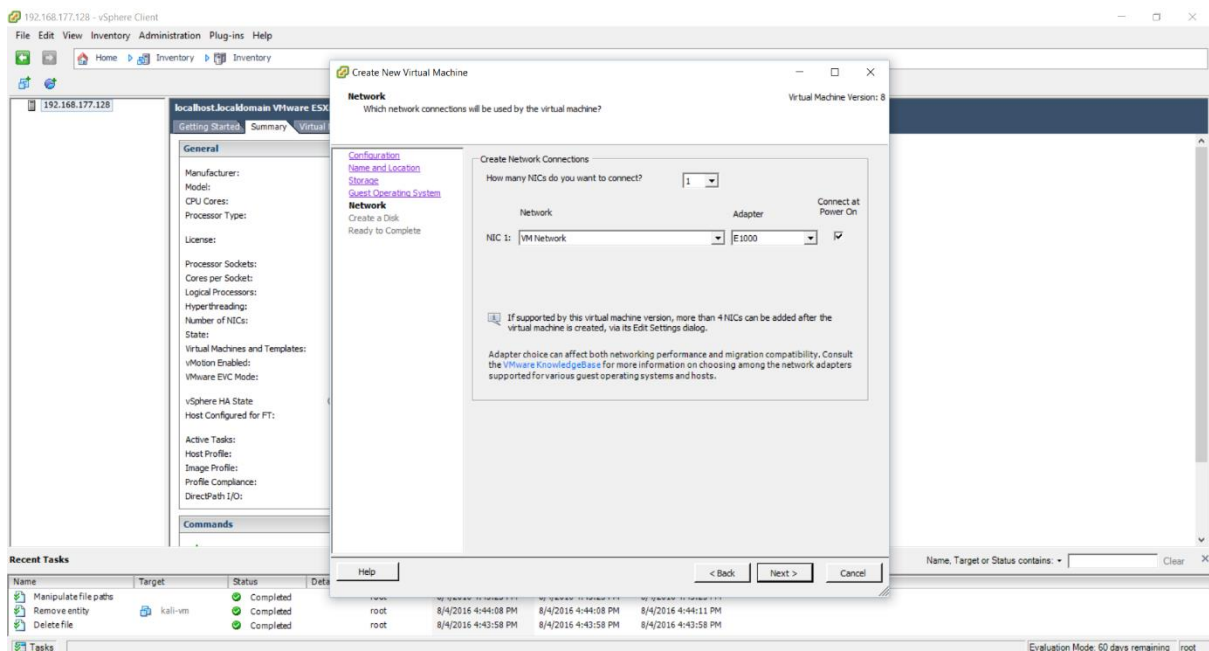

Step 10: At ‘Storage’ section click ‘Next’.

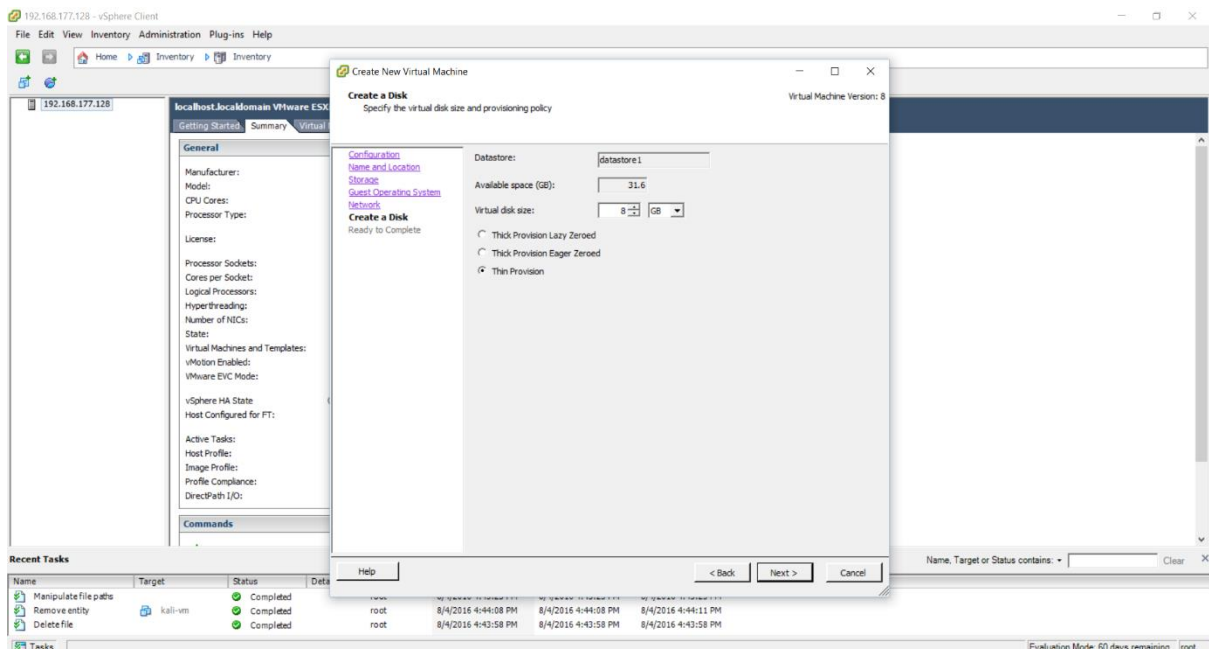

Step 11: Select ‘Linux’ then Choose ‘Other Linux (64-bit)’ and click ‘Next’.

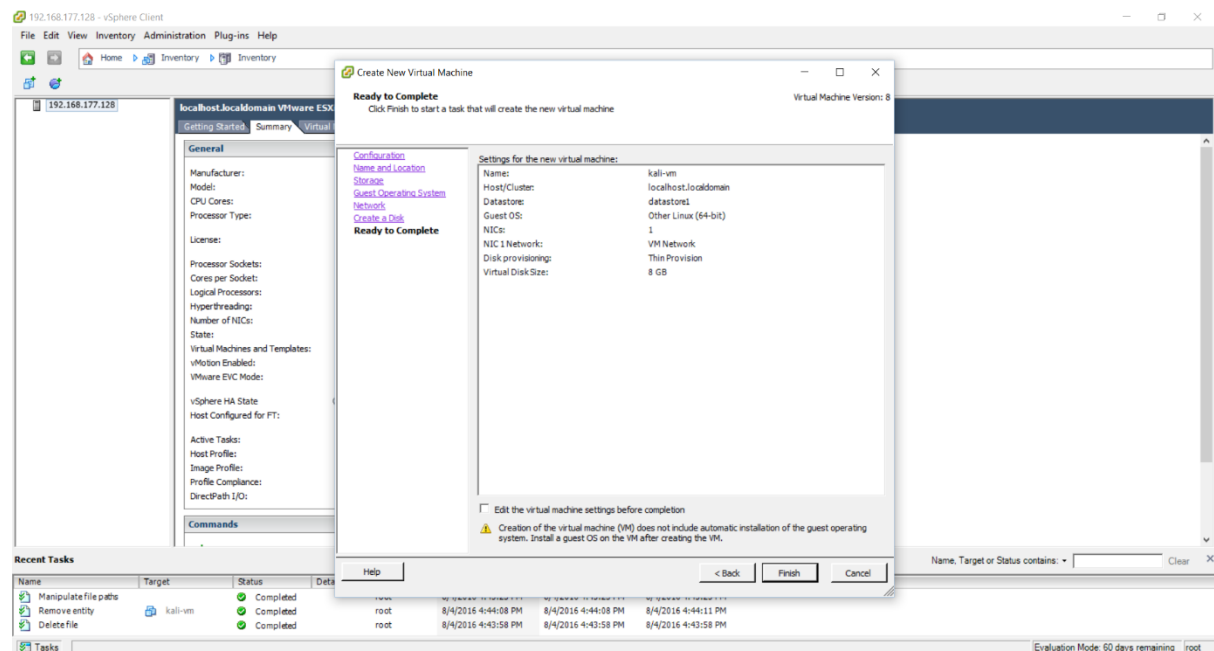

Step 12: Click 'Next' on 'Network' section.

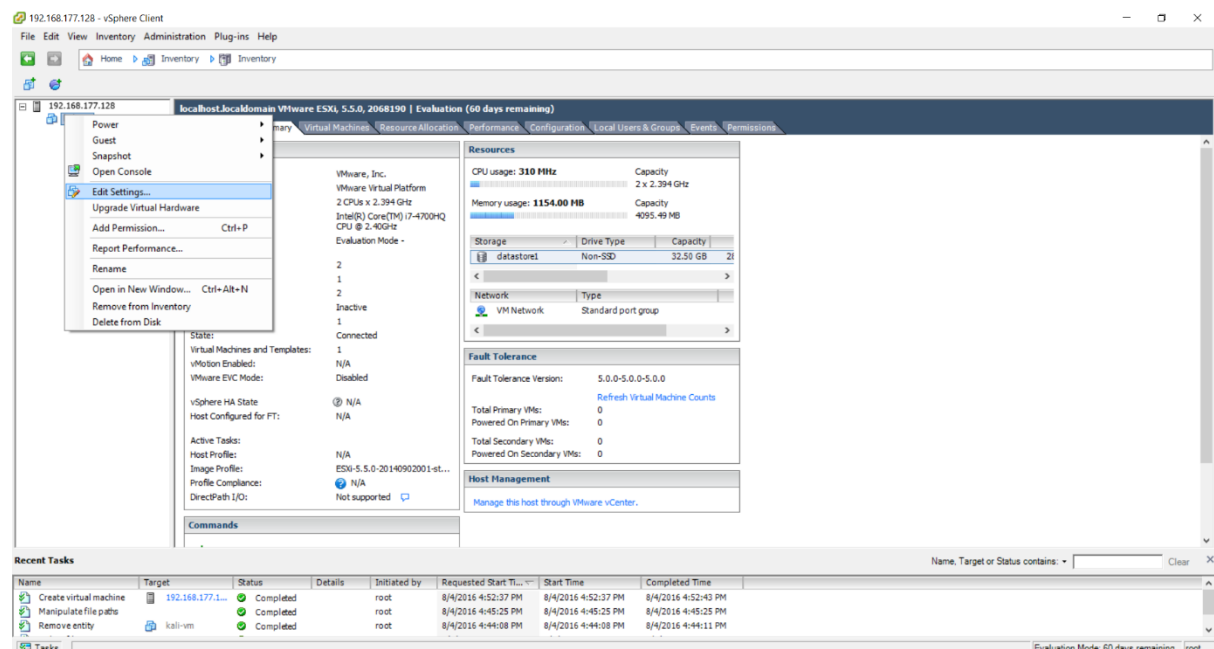

Step 13: At 'Create a Disk' select 'Thin Provision'.

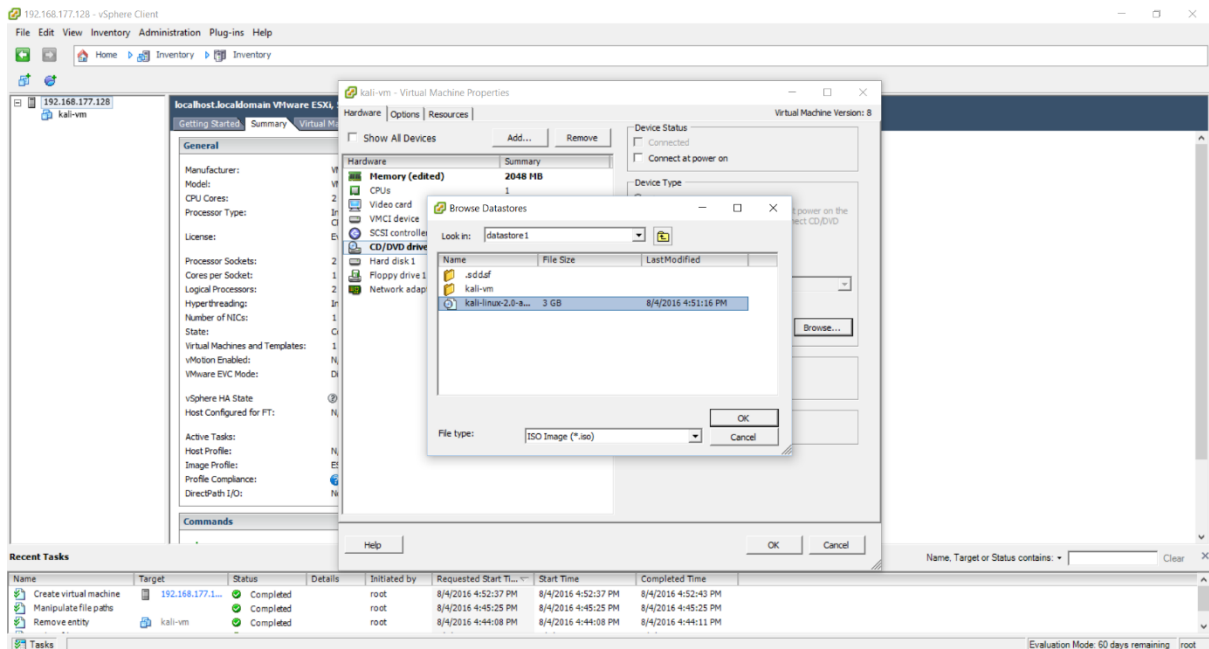

Step 14: Click on 'Finish'.

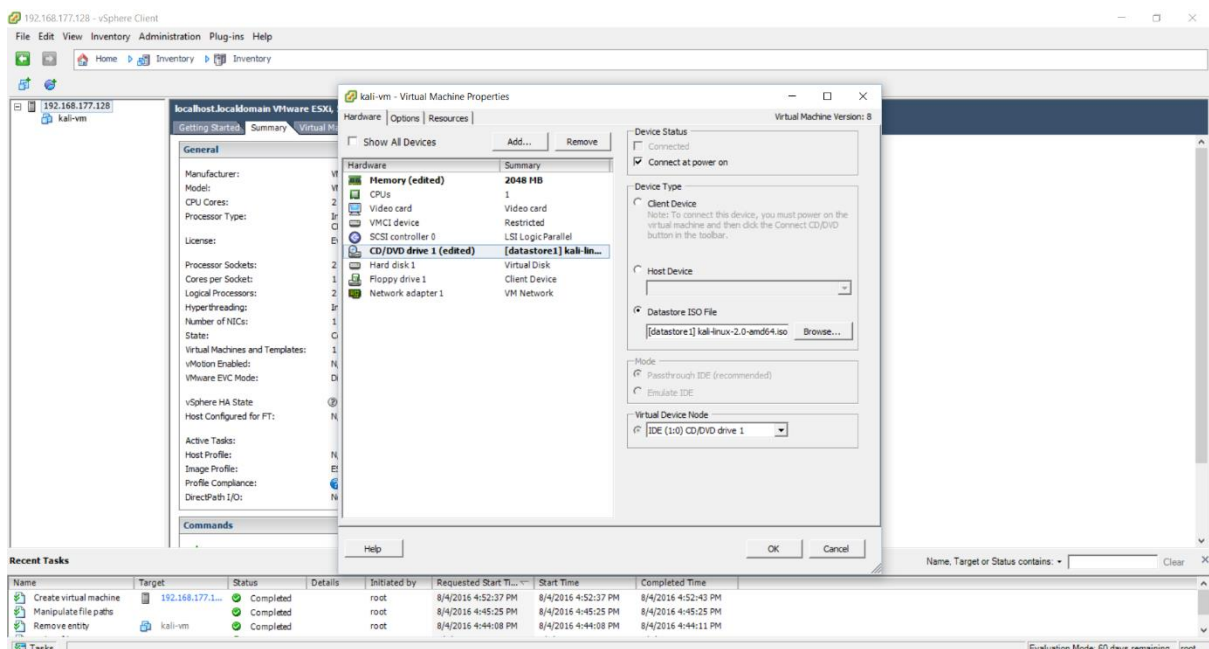

Step 15: Edit Settings of the created virtual machine.

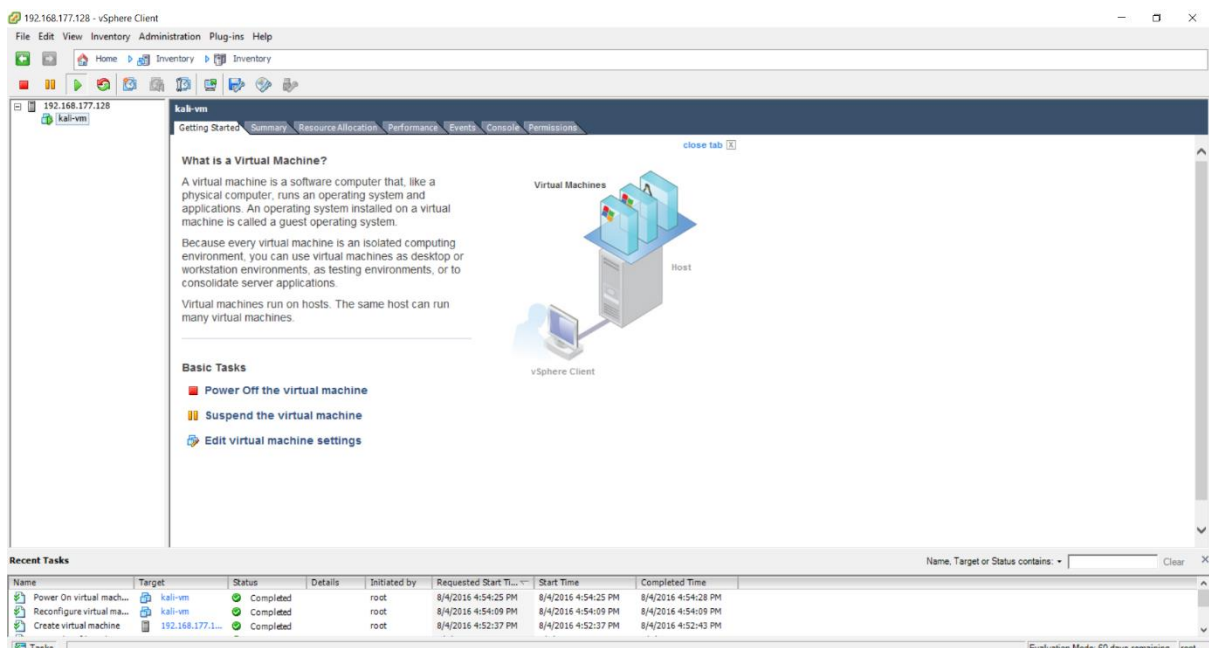

Step 16: Configure the memory size to be 2048 MB. Select ‘CD/DVD drive 1’ and choose ‘Datastore ISO File’ and browse for the OS file from datastore.

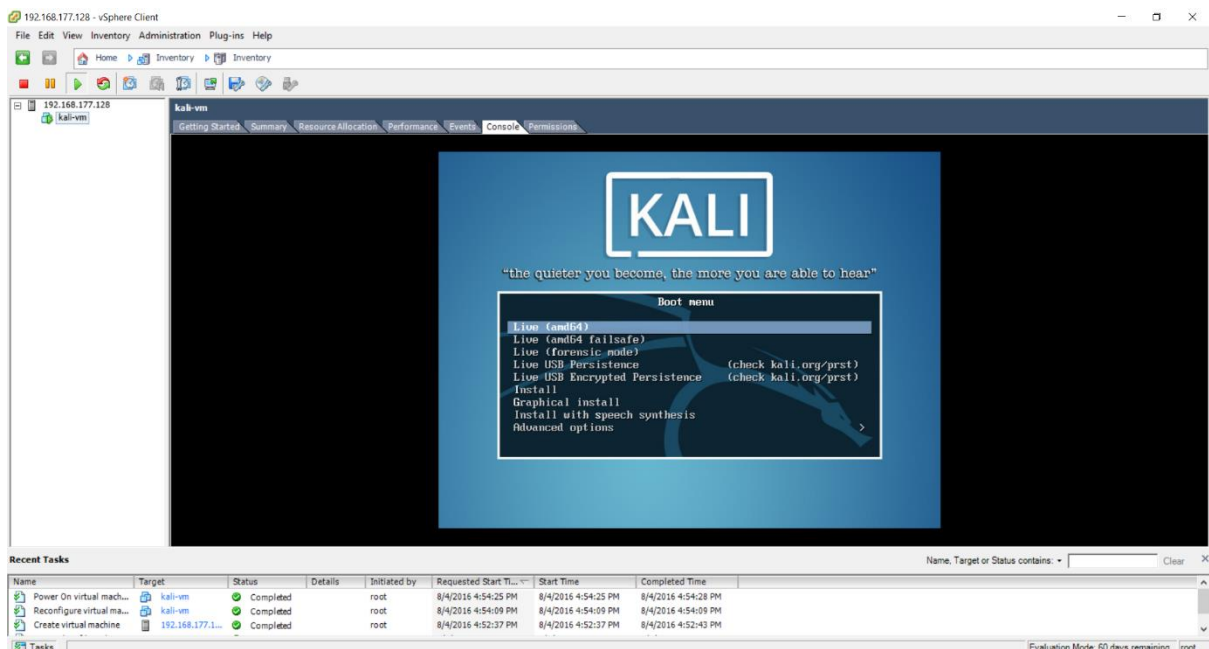

Step 17: Choose ‘Connect at power on’ and click ‘OK’.

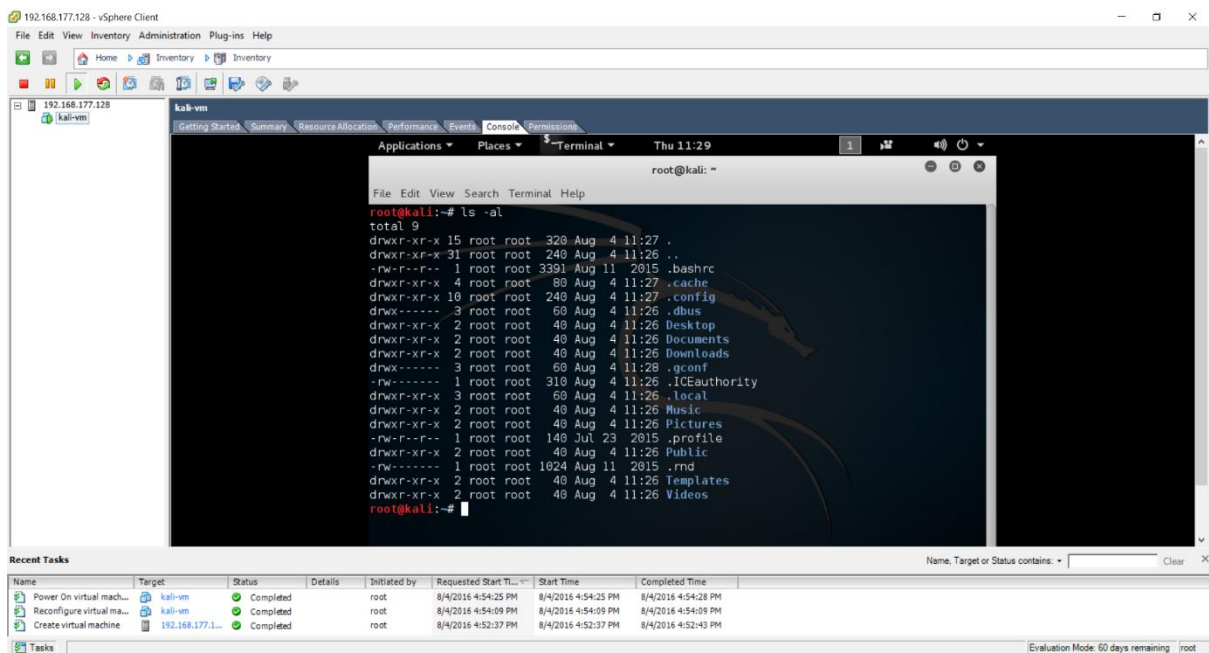

Step 18: Boot the virtual machine.

Step 19: Go to the 'Console' tab and choose 'Live (amd64)' and press 'Enter' to start installing the OS in the virtual machine. Here Kali OS is used.

Step 20: type the below command in a terminal to check the operational state.

Step 21: Power off 'Kali' and shut down 'ESXi' to finish the installation.
